Customer

Appswireless

Aim

Developing of application for iPhone, this is based on chosen or taken pictures, which were made by customer.

Solution

For developing of application there were used graphic elements, which were given by customer. Customer can create image on the base of chosen or taken picture. We developed component, which gives a capability of aliasing diferent cliparts (hat, shoes and etc.) on selected background (photo).

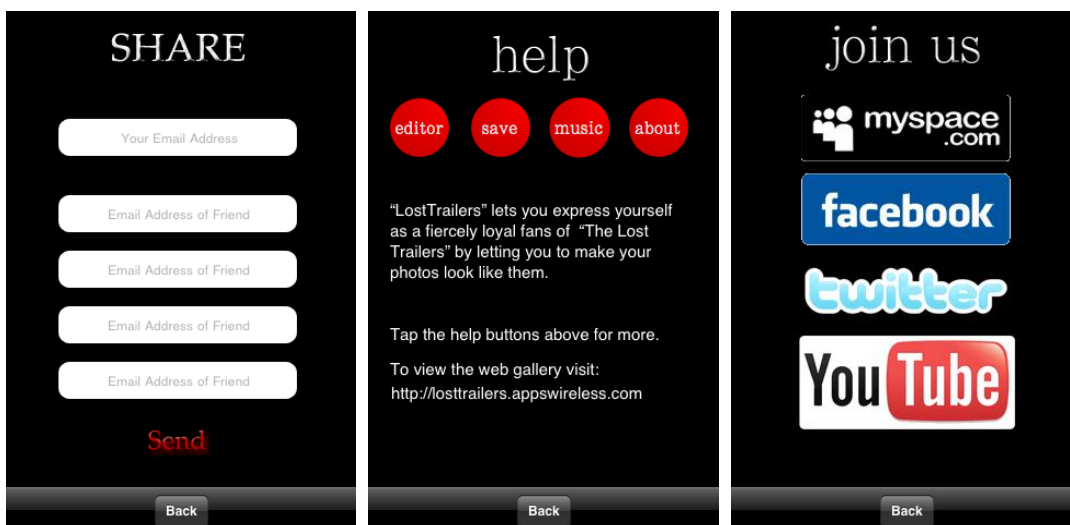

For changing the setting of layer we used MultiTouch technology (element drags with one finger, zoom/turn - with two).

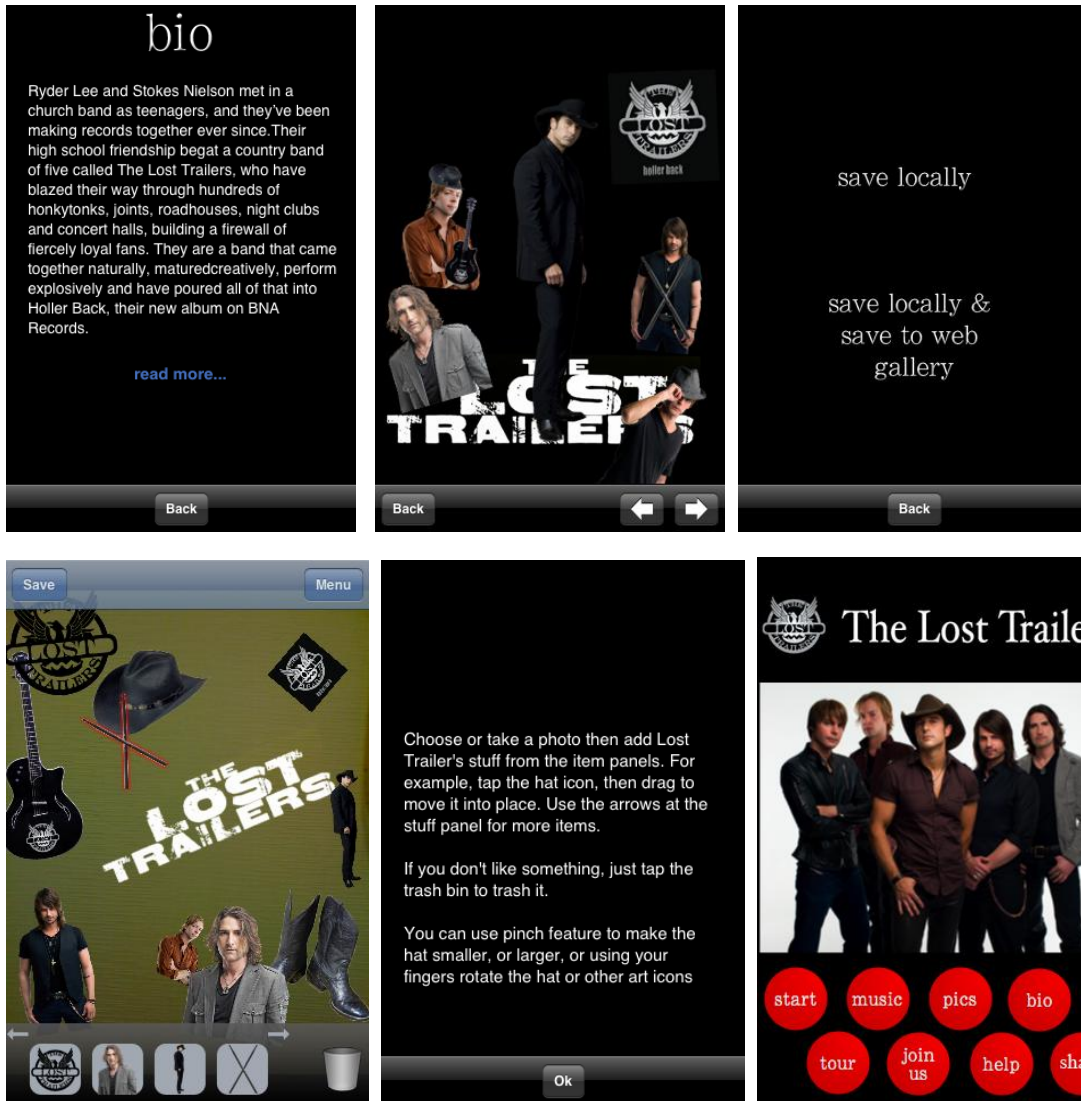

For sending pictures on server we developed web gallery. Also we realised function «share with friends».

Basic Functions and Effects

- Choosing the image from photo roll.
- Choosing the image from favourites (its own component).
- Choosing a clipart from the library (its own component).
- Saving the result in photo roll and in favorites.
- Movement/change of the scale/turn of the chosen element of a scene.
- Movement and change of the scale of a scene.
- Share with friends.
- Send image to the web gallery.
