

Application-name's finder

Aim

Developing of application, this works with web-servers. The idea of application is in entering the name and getting the first ten results of search with this name from Google.com.

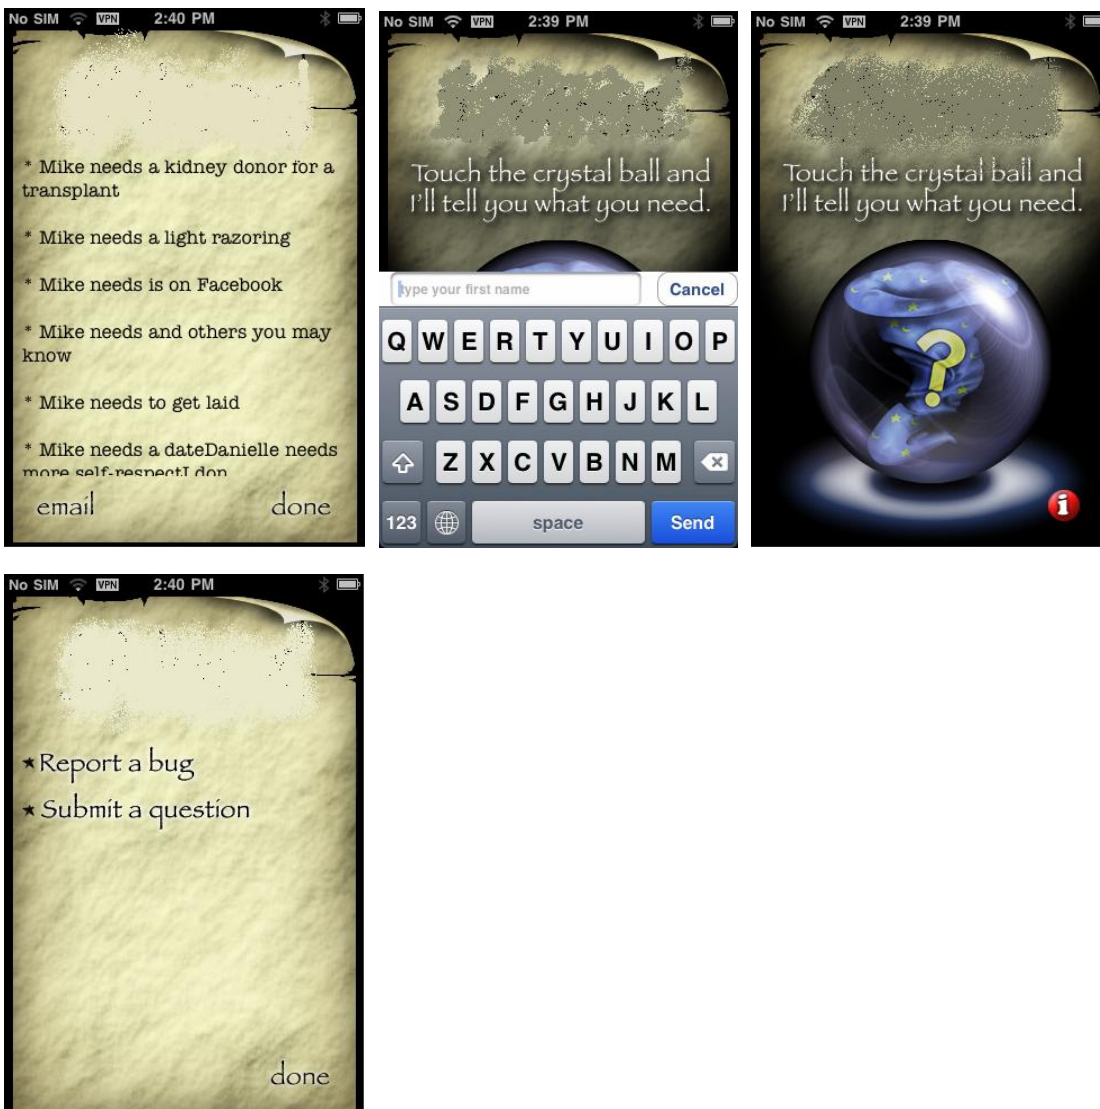

Solution

For developing of application there were used graphic elements, which were given by customer. For realisation of basic function we develop parcel for Google. It divides the page of results and downloads information from this page. More over there are 50 alternative answers, which are kept separately in application and are given out, when there are less than 10 results of search.

Basic Functions and Effects

- Entering the name.
- Viewing results.

Screenshots

Technologies

Xcode, Objective C, iPhone SDK.

Software Product

The real product name is under the NDA
